Linked to an appropriate water source by a main feeder hose, they provide a slow and steady flow of water. An alternative to drip irrigation is trickle tape - essentially a length of hose with built in drip emitters. Drip irrigation provides water near the base of the plant, leaving the upper foliage dry and less susceptible to fungi.

Open pressure compensated dripper Drip irrigation is a type of micro-irrigation system that has the potential to save water and nutrients by allowing water to drip slowly to the roots of plants, either from above the soil surface or buried below the surface. The goal is to place water directly into the root zone and minimize evaporation.

## **Drip irrigation - Wikipedia**

Closed circuit trickle irrigation is a form of micro irrigation that increases energy and water efficiency by using closed circuit drip irrigation systems designs. Modifications are made to traditional micro irrigation methods to reduce some of the problems and constraints, such as low compressor water at the end of irrigation lines.

With a drip irrigation system, irrigation (water use replenishment) should be done daily, on alternating days or every third day (as needed). An irrigation schedule (the daily amount of water to apply) may be developed by tracking water entering and leaving the root zone - this is called a water budget.

Flashcards are a relatively popular learning tool. Flashcards are useful for self-testing or retrieval practice and can be used to enhanced recall through spaced repetition. They are best suited to memorization and should be combined with other learning strategies to promote deeper understanding. Ideally, a topic should be understood before flashcards are used.
