The original Airy beam in two spatial dimensions, with its curved caustic, is stable in this sense. But the separable Airy-product beam in three-dimensions is unstable: under separability-breaking perturbation, it unfolds into the hyperbolic umbilic diffraction catastrophe, which is stable.

Optical beams with an underlying caustic structure are stable under perturbation if the caustics belong to the catastrophe-theory classification; otherwise they are unstable. The original Airy beam in two spatial dimensions, with its curved caustic, is stable in this sense. But the separable

Stability related to temperatures aloft and adiabatic cooling. In each situation, the balloon is filled at sea level with air at 31° C, carried manually to 5,000 feet, and released. In each case, air in the balloon expands and cools to 16° C (at the dry adiabatic rate of 3° C per 1,000 feet). ... Whether the air is stable or unstable within ...

If the environmental lapse rate is steep then one knows the atmosphere is unstable. But if the lapse rate is small, meaning there's relatively little change in temperature, it's a good indication of a stable atmosphere. The most stable conditions occur during a temperature inversion when temperature increases (rather than decreases) with height.

Stable stratifications can become unstable if layers change density. This can happen due to outside influences (for instance, if water evaporates from a freshwater lens, making it saltier and denser, or if a pot or layered beverage is heated from below, making the bottom layer less dense). However, it can also happen due to internal diffusion of heat (the warmer layer slowly heats the adjacent ...

Atmospheric instability is a condition where the Earth's atmosphere is generally considered to be unstable and as a result the weather is subjected to a high degree of variability through distance and time. [clarification needed] Atmospheric stability is a measure of the atmosphere's tendency to discourage or deter vertical motion, and vertical motion is directly correlated to different types ...

Stable Angina: Causes, Symptoms, and Treatment

Many have heard of individuals suffering from stable or unstable angina, but the difference between the two is often murky and unclear. Angina is often a symptom of one of the most common types of heart disease in adults: coronary heart disease(CHD).

Stable And Unstable Angina: What's The Difference?

Stable angina and unstable angina are two clinical entities in cardiology caused by reduced blood supply to the heart muscle. High serum cholesterol level leads to deposition of cholesterol on the blood vessel wall. This is called atheromatous plaque formation.
